

A Deep Neural Network Optimization Framework Based on Optimal Transport Bridge Feature Selection and Sparse Representation

Guipeng Lan, Shuai Xiao, Jiabao Wen, Jiachen Yang, Wen Lu, Baihua Li, Qinggang Meng, Xinbo Gao

The paper proposes an Informative Sparse Transport (IST) framework that unifies feature selection and sparse representation into one multi-objective optimization, using Sinkhorn-based optimal transport as a bridge to align their distributions, thereby improving both generative (lower FID, less mode collapse) and classification (higher accuracy, better interpretability) performance of DNNs.
